End-to-end architecture: data → fusion → twin → apps

Data flows left to right (1 → 5) every 5 minutes. The doctor dashboard, patient PWA and caregiver view are role-based clients of the same twin.

Real-time loop and doctor-initiated patient provisioning

1. World advances 5 min
2. Record ingested (minimised)
3. Twin syncs + recalibrates
4. Prediction + explanation
5. Notifications (caps, safety)
6. Push via WebSocket

Any non-terminal state → REVOKED; REVOKED → INVITED re-launches. Every transition is audited. No twin data reaches the patient app unless ACTIVE.
